

Business Requirements Document (BRD)

Hotel Booking Cancellation Dashboard

Document Control

- Prepared by: Rehmat Kaur
- Project Sponsor(simulated): Meridian Hotel Group - Operations & Revenue Management
- Status: Draft v1.0
- Data note: Built on a hotel booking dataset in Excel, created for a portfolio application; not a live PMS/booking-engine feed. Adjust the breakdown categories (lead time, room type, channel) to match your actual dataset's columns.

1.Purpose

This document defines the business requirements for a dashboard that helps hotel operations understand booking cancellation patterns, so the team can identify which bookings are most at risk of cancelling and take steps to reduce lost revenue.

2.Business Objectives

- Give the Operations Manager a clear view of overall cancellation rate without manually filtering raw booking exports.
- Identify which booking characteristics (lead time, room type, channel) are associated with higher cancellation rates.
- Support revenue management decisions (e.g. overbooking strategy) with cancellation trend data.

3.Scope

- In ScopeOverall cancellation rate as a headline metric.
- Cancellation rate broken down by booking lead time, room type, and booking channel.

- Pivot-table-driven drilldown so the Operations Manager can explore a specific segment.

Out of Scope

- Automated overbooking or pricing adjustments based on the analysis.
- Live integration with a property management system (PMS) or booking engine.
- Guest-level personal data / CRM functionality.

4.Stakeholders

- Operations Manager — primary consumer; uses the dashboard to spot high-cancellation segments.
- Revenue Manager — consumer of lead-time and channel breakdowns; uses them to inform overbooking/pricing strategy.

5.Functional Requirements

ID	Requirement	Priority	Acceptance Criteria
FR-1	Dashboard shall display overall booking cancellation rate as a headline KPI.	High	Given the booking dataset is loaded, when the dashboard opens, then the cancellation rate KPI matches (cancelled bookings ÷ total bookings) from the underlying data.
FR-2	Dashboard shall break down cancellation rate by lead-time buckets (0–7, 8–30, 31–90, 90+ days).	High	Given the lead-time field exists, when the breakdown view renders, then every booking falls into exactly one bucket, each with its own cancellation rate.
FR-3	Dashboard shall break down cancellation rate by room type and booking channel.	Medium	Given room type and channel fields exist, when the breakdown view renders, then cancellation rate is shown separately for each room type and each channel.
FR-4	Dashboard shall allow the user to drill into any segment via pivot table filters.	Medium	Given a segment is selected, when the filter is applied, then all KPIs and charts update to reflect only that segment.

6.Non-Functional Requirements

- Usability: Must be readable by a non-technical Operations Manager without a walkthrough.
- Maintainability: Underlying pivot tables/formulas should be documented so the workbook can be refreshed with new data each period.

7.Assumptions & Constraints

- Dataset is a static export covering a fixed historical period, not a live feed.
- Cancellation reason (if not present in the dataset) is out of scope — only the fact and pattern of cancellation is analyzed.

8.Acceptance Sign-off Criteria

This phase is complete when: the headline cancellation rate (FR-1) and all three breakdowns (FR-2, FR-3, FR-4) are built, all acceptance criteria pass, and the Operations Manager persona can answer "which segment cancels the most" without assistance.
